

NOISE PROTECTION WALL KITZSEE

AUSTRIA

The entire noise and glare protection structures along both carriageways of the A6 North-East motorway were originally made of wooden elements. The wooden structures have proven to be susceptible to weather conditions (snow, rain, wind, etc.), UV light and road salt, and some of them have rotted. The existing noise barrier panels must therefore be removed and replaced with new ones.

On behalf of ASFINAG, convex ZT GmbH is responsible for the tender and execution design applying the BIM methodology.
